Degree: B.E - AI & DS

## NeoColab\_REC\_CS23231\_DATA STRUCTURES

REC\_DS using C\_Week 4\_COD\_Question 5

Attempt : 1 Total Mark : 10 Marks Obtained : 10

Section 1: Coding

#### 1. Problem Statement

You are tasked with implementing basic operations on a queue data structure using a linked list.

You need to write a program that performs the following operations on a queue:

Enqueue Operation: Implement a function that inserts an integer element at the rear end of the queue.Print Front and Rear: Implement a function that prints the front and rear elements of the queue. Dequeue Operation: Implement a function that removes the front element from the queue.

### Input Format

The first line of input consists of an integer N, representing the number of elements to be inserted into the queue.

The second line consists of N space-separated integers, representing the queue elements.

## **Output Format**

The first line prints "Front: X, Rear: Y" where X is the front and Y is the rear elements of the queue.

The second line prints the message indicating that the dequeue operation (front element removed) is performed: "Performing Dequeue Operation:".

The last line prints "Front: M, Rear: N" where M is the front and N is the rear elements after the dequeue operation.

Refer to the sample output for the formatting specifications.

#### Sample Test Case

```
Input: 5
    12 56 87 23 45
   Output: Front: 12, Rear: 45
   Performing Dequeue Operation:
   Front: 56, Rear: 45
   Answer
   #include <stdio.h>
#include <stdlib.h>
   struct Node {
     int data:
      struct Node* next:
   };
   struct Node* front = NULL;
   struct Node* rear = NULL;
   void enqueue(int d) {
      struct Node* nn = (struct Node*)malloc(sizeof(struct Node));
   nn->data = d;
     nn->next = NULL;
```

```
if (rear == NULL) {
     front = rear = nn;
   } else {
     rear->next = nn;
     rear = nn;
   }
}
 void printFrontRear() {
   if (front == NULL) {
     printf("Queue is empty.\n");
   } else {
     printf("Front: %d, Rear: %d\n", front->data, rear->data);
void dequeue() {
   if (front == NULL) {
     printf("Queue is empty. Cannot dequeue.\n");
     return:
   }
   struct Node* temp = front;
   front = front->next;
   if (front == NULL) {
     rear = NULL;
int main() {
   int n, data;
   scanf("%d", &n);
   for (int i = 0; i < n; i++) {
     scanf("%d", &data);
     enqueue(data);
   }
   printFrontRear();
   printf("Performing Dequeue Operation:\n");
   dequeue();
   printFrontRear();
                                                    241801094
   return 0;
```

Status: Correct Marks: 10/10
